This is a program that allows you quickly edit digital video into clips. Be sure to transfer your DVD to a digital file before you start creating clips. MPEG Streamclip will not work from some DVDs due to copyright restrictions.

To download MPEG Streamclip, go to this website:
http://www.squared5.com/
Make sure that you download the appropriate version for a Mac or PC.

To start, go to File, Open Files:

Next, migrate to the digital file you are working from. I usually use a file that I made in Handbrake (an open source video encoder program), an M4V file.

Once you have the digital file imported, you can start creating your clips. To set your “in” point (the beginning of the clip) simply push “I” on the timeline. To select the end of the clip, simply push “O” on the timeline. Now your screen should look like this, with your clip highlighted on the timeline.
Now go back to File and select the export option that you desire:

Notice from the screenshot above that you have an option of many different files to export. Once you select the desired file type, you will see a screen like this:

Select your desired export options, but it is fine to simply click the “Make MP4” button at the bottom in order to create your file.
Once you click this button, be sure to name your file and know where you are sending the file on your computer.
